Outline

1 Introduction

- Basics
- Nonlocal games
- A special case of nonlocal games
- A specific example

2 Local and quantum correlation matrices

- Local correlation matrices
- Quantum correlation matrices
- The relations between quantum correlation and local correlation matrices

3 Grothendieck Inequality

Let's get on the same page

- We should know what a *state* is

Let's get on the same page

- We should know what a *state* is
 - ▶ i.e. a psd matrix ρ that satisfies $\text{Tr}(\rho) = 1$

Let's get on the same page

- We should know what a *state* is
 - ▶ i.e. a psd matrix ρ that satisfies $\text{Tr}(\rho) = 1$
- We should know what the *tensor product* does

Let's get on the same page

- We should know what a *state* is
 - ▶ i.e. a psd matrix ρ that satisfies $\text{Tr}(\rho) = 1$
- We should know what the *tensor product* does

- ▶ We use the Kronecker product $A \otimes B = \begin{pmatrix} a_{11}B & \dots & a_{1n}B \\ \vdots & & \vdots \\ a_{n1}B & \dots & a_{nn}B \end{pmatrix}$

- We should be familiar with the *Dirac notation*

Let's get on the same page

 - ▶ i.e. a psd matrix ρ that satisfies $\text{Tr}(\rho) = 1$
- We should know what the *tensor product* does
 - ▶ We use the Kronecker product $A \otimes B = \begin{pmatrix} a_{11}B & \dots & a_{1n}B \\ \vdots & & \vdots \\ a_{n1}B & \dots & a_{nn}B \end{pmatrix}$
- We should be familiar with the *Dirac notation*
 - ▶ $|\psi\rangle$ is a vector in \mathbb{C}^n and $\langle\psi|$ is its conjugate transpose

Quantum systems

- A quantum system is a portion of the whole universe. For example a set of electrons.
- A quantum system X is associated with a copy of \mathbb{C}^k
- It may consist of subsystems X_1, \dots, X_N each of which is associated with a copy of \mathbb{C}^{n_i} . In this case $k = n_1 \dots n_N$

Measurements

- A measurement can be performed on a system X that is in state ρ
- Let \mathcal{A} be a finite set of outcomes of the measurement
- The measurement itself is defined by a set of psd matrices $\{F^a\}_{a \in \mathcal{A}} \subseteq \mathbb{C}^{n \times n}$ that sum up to the identity matrix, i.e. $\sum_{a \in \mathcal{A}} F^a = I$
- A projective measurement is defined by psd matrices that satisfy $F^a F^b = \delta_{ab} F^a \ \forall a, b \in \mathcal{A}$
- The outcome of a measurement is a random variable χ with probability distribution: $\mathbb{P}[\chi = a] = \text{Tr}(\rho F^a)$

- To define an expected value we define outcomes in \mathcal{A} as real numbers
- $\mathbb{E}[\chi] = \sum_{a \in \mathcal{A}} a \text{Tr}(\rho F^a) = \text{Tr}(\rho(\sum_{a \in \mathcal{A}} a F^a))$
- $\sum_{a \in \mathcal{A}} a F^a$ is called observable
- A simple case we will use later are $\{-1, 1\}$ -valued observables
- if we consider projective measurements we have

$$(F^+ - F^-)^2 = \underbrace{F^{+2}}_{=F^+} - \underbrace{F^+ F^-}_{\delta_{+-}=0} + \underbrace{F^{-2}}_{F^-} = F^+ + F^- = I$$

- i.e. a $\{-1, 1\}$ -valued observable is both unitary and Hermitian

Doling out subsystems

- Consider a system X consisting of subsystems X_1, \dots, X_N which we distribute among N parties, which may be located anywhere in the universe
- The parties *share* the state X is in
- Every party may perform a measurement on their subsystem X_i , i.e. there are N sets of psd matrices $\{F^{a_1}\}_{a_1 \in \mathcal{A}_1} \in \mathbb{C}^{n_1 \times n_1}, \dots, \{F^{a_N}\}_{a_N \in \mathcal{A}_N} \in \mathbb{C}^{n_N \times n_N}$

T

he joint probability distribution of the N measurement outcomes χ_1, \dots, χ_N is

$$\mathbb{P}[\chi_1 = a_1, \chi_2 = a_2, \dots, \chi_N = a_N] = \text{Tr}(\rho F_1^{a_1} \otimes \dots \otimes F_N^{a_N})$$

Entanglement

- We will only consider pure states meaning states that they have rank 1 and therefore can be written as $\rho = |\psi\rangle\langle\psi|$
- A state is called product state if it can be written as $|\psi\rangle = |\psi_1\rangle|\psi_2\rangle \dots |\psi_N\rangle$
- When a vector $|\psi\rangle$ is referred to as a state we mean the matrix $|\psi\rangle\langle\psi|$
- A state that is not a product state is called entangled

Example

- Let $|\psi\rangle = |\psi_A\rangle|\psi_B\rangle$ be a system and give $|\psi_A\rangle$ to Alice and $|\psi_B\rangle$ to Bob
- Let them perform measurements $\{G^b\}_{b \in \mathcal{B}}$ and $\{F^a\}_{a \in \mathcal{A}}$ on their respective quantum systems
- What is the probability of Alice getting measurement outcome $\chi_A = a$ and Bob getting $\chi_B = b$?

Example

$$\begin{aligned}\mathrm{Tr}(|\psi\rangle\langle\psi|F^a \otimes G^b) &= \langle\psi|F^a \otimes G^b|\psi\rangle \\ &= (\langle\psi_A| \otimes \langle\psi_B|)(F^a \otimes G^b)(|\psi_A\rangle \otimes |\psi_B\rangle) \\ &= ((\langle\psi_A|F^a) \otimes (\langle\psi_B|G^b))(|\psi_A\rangle \otimes |\psi_B\rangle) \\ &= \langle\psi_A|F^a|\psi_A\rangle \otimes \langle\psi_B|G^b|\psi_B\rangle \\ &= \langle\psi_A|F^a|\psi_A\rangle \langle\psi_B|G^b|\psi_B\rangle\end{aligned}$$

This is equal to the product of the probabilities of Alice measuring a and Bob measuring b , i.e. the outcome do not correlate.

Nonlocal games

- Three participants: Alice, Bob and a referee
- Referee does out a question s to Alice and a question t to Bob
- Alice and Bob are assumed to be located anywhere in the universe respectively
- Alice and Bob must not communicate
- Alice sends answer a Bob sends answer b back to the referee, who then decides whether both win or both lose

Nonlocal games

Mathematically speaking

- Four finite sets $\mathcal{A}, \mathcal{B}, \mathcal{S}, \mathcal{T}$
- probability distribution π over $\mathcal{S} \times \mathcal{T}$
 $\pi : \mathcal{S} \times \mathcal{T} \rightarrow [0, 1]$
- The referee sends with probability $\pi(s, t)$ s to Alice and t to Bob
- They answer with an element $a \in \mathcal{A}$ and $b \in \mathcal{B}$ respectively
- A map $V : \mathcal{S} \times \mathcal{T} \times \mathcal{A} \times \mathcal{B} \rightarrow \{0, 1\}$
- They win if $V(s, t, a, b) = 1$ and lose otherwise

Classical strategies

- All players know π and V and the information they received but not what the other players received
- They are allowed to agree on a strategy beforehand but must not communicate once the game started
- A deterministic strategy is a map $a : \mathcal{S} \rightarrow \mathcal{A}$ for Alice and $b : \mathcal{T} \rightarrow \mathcal{B}$ for Bob The winning probability then is:

$$\mathbb{E}_{s,t \sim \pi} [V(a(s), b(t), s, t)]$$

Quantum case

- Suppose Alice and Bob have a subsystem X_A, X_B of a quantum system X which is in state ρ , i.e. Alice and Bob share state ρ
- If the state is entangled measurements can give correlated measurement outcomes
- Alice and Bob may gain information by performing measurements
- Answering according to measurement outcomes could increase winning probability

Mathematically speaking

- A quantum system X consisting of two n -dimensional subsystems X_A, X_B in some entangled state ρ
- Alice performs a measurement $\{F_s^a\}_{a \in \mathcal{A}} \subseteq \mathbb{C}^{n \times n}$ on her subsystem X_A and Bob performs a measurement $\{G_t^b\}_{b \in \mathcal{B}} \subseteq \mathbb{C}^{n \times n}$ on his subsystem X_B
- They send their measurement outcome as their answer to the referee
- Their winning probability is:

$$\mathbb{E}_{s,t \sim \pi} \left[\sum_{a \in \mathcal{A}} \sum_{b \in \mathcal{B}} \text{Tr}(\rho F_s^a \otimes G_t^b) V(a, b, s, t) \right]$$

Two player XOR games

- Let the sets \mathcal{A} and \mathcal{B} be $\{0, 1\}$, so Alice and Bob both answer either with 1 or 0
- The predicate V is defined as $V(a, b, s, t) = [a \oplus b = f(s, t)]$, where $f : \mathcal{S} \times \mathcal{T} \rightarrow \{0, 1\}$
- A truth table for $a \oplus b$ looks like this

\oplus	0	1
0	0	1
1	1	0

Bias and violation ratio

- Alice and Bob can always win with probability $\frac{1}{2}$ by flipping an unbiased coin
- The classical bias of an XOR game G is defined as the difference of the probabilities of winning and losing for an optimal strategy and denoted by $\beta(G)$
- The bias $\beta^*(G)$ of entangled strategies is calculated the same way
- It is twice the amount by which the maximal winning probability exceeds $\frac{1}{2}$
- Since $\frac{1}{2} + \gamma - (1 - \frac{1}{2} - \gamma) = 2\gamma$
- The violation ratio is defined as $\frac{\beta^*(G)}{\beta(G)}$

Signs and observables

- It is convenient to use the $\{-1, 1\}$ -basis instead of the $\{0, 1\}$ -basis for boolean valued objects.
- Let $a : \mathcal{S} \rightarrow \{0, 1\}$ and $b : \mathcal{T} \rightarrow \{0, 1\}$ be classical strategies and π the probability distribution the referee uses to pick s, t
- The bias is given by the probability under π that $a(s) \oplus b(t) = f(s, t)$ minus the probability under π that $a(s) \oplus b(t) \neq f(s, t)$

This means the bias can be written as:

$$\begin{aligned} & \mathbb{E}_{(s,t) \sim \pi} \left[(-1)^{[a(s) \oplus b(t) = f(s,t)]} \right] = \\ &= \mathbb{E}_{(s,t) \sim \pi} \left[(-1)^{a(s) \oplus b(t) + f(s,t)} \right] = \\ &= \mathbb{E}_{(s,t) \sim \pi} \left[(-1)^{a(s)} (-1)^{b(t)} (-1)^{f(s,t)} \right] \end{aligned}$$

And we can define the sign matrix $\Sigma_{s,t} = (-1)^{f(s,t)}$ and functions $\chi(s) = (-1)^{a(s)}$ and $\psi(t) = (-1)^{b(t)}$. So the bias is

$$\mathbb{E}_{(s,t) \sim \pi} [\chi(s) \psi(t) \Sigma_{st}]$$

- The outcomes in an XOR game are $\{0, 1\}$
- Alice and Bob have measurements $\{F_s^0, F_s^1\}$ and $\{G_t^0, G_t^1\}$ and share an entangled state
- The probability of Alice and Bob answering with a, b upon receiving s, t respectively is $\langle \psi | F_s^a \otimes G_t^b | \psi \rangle$
- Lets calculate the expected value of $(-1)^{a \oplus b}$

$$\begin{aligned}
 & (1) \cdot \mathbb{P}[a = b] + (-1) \cdot \mathbb{P}[a \neq b] = \\
 & = \langle \psi | F_s^0 \otimes G_t^0 | \psi \rangle + \langle \psi | F_s^1 \otimes G_t^1 | \psi \rangle \\
 & \quad - \langle \psi | F_s^1 \otimes G_t^0 | \psi \rangle - \langle \psi | F_s^0 \otimes G_t^1 | \psi \rangle \\
 & = \langle \psi | (F_s^0 - F_s^1) \otimes (G_t^0 - G_t^1) | \psi \rangle
 \end{aligned}$$

- Define $\{-1, 1\}$ -observables $F_s = F_s^0 - F_s^1$ and $G_t = G_t^0 - G_t^1$ with the property that its difference squared is the identity matrix
- Using this strategy the bias becomes

$$\mathbb{E}_{(s,t) \sim \pi} [\langle \psi | F_s \otimes G_t | \psi \rangle \Sigma_{s,t}]$$

More generally speaking

- For any XOR game the bias is defined as the difference of the probabilities of winning and losing
- Which is, if considering the $\{-1, 1\}$ basis, the expected value
- We are looking to maximize this quantity

Classical strategies

When using classical strategies this is

$$\max\{\mathbb{E}_{(s,t)\sim\pi} [\sum_{st}\chi(s)\psi(t)] : \chi : \mathcal{S} \rightarrow \{-1,1\}, \\ \psi : \mathcal{T} \rightarrow \{-1,1\}\}$$

Entangled strategies

When using entangled strategies the winning probability might increase indefinitely with the dimensions, so we use the $\sup_{n \in \mathbb{N}}$

$$\sup_{n \in \mathbb{N}} \{ \mathbb{E}_{(s,t) \sim \pi} [\sum_{st} \langle \psi | F_s \otimes G_t | \psi \rangle] : |\psi\rangle \in \mathbb{C}^n \otimes \mathbb{C}^n, \\ F_s, G_t \in O(\mathbb{C}^n) \}$$

The CHSH game

- The CHSH game (Clauser, Horner, Shimony, Holt) is a two player XOR game with $\mathcal{A} = \mathcal{B} = \mathcal{S} = \mathcal{T} = \{0, 1\}$ and π being the uniform distribution
- $f(s, t) = s \wedge t$, i.e. $f(1, 1) = 1$ and $f(0, 0) = f(0, 1) = f(1, 0) = 0$
- Alice and Bob can win $\frac{3}{4}$ of the games by using deterministic strategies $(0, 0)$, $(1, 0)$ or $(0, 1)$

Quantum strategy

- Let Alice and Bob share an EPR state
- Define

$$X = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, Y = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$$

- $XY + YX = 0$ and $X^2 = Y^2 = I$
- For Alice define the observable for question 0 by $F_0 = X$ and for question 1 by $F_1 = Y$
- Bobs observables are going to be $G_0 = (X - Y)/\sqrt{2}$ for question 0 and $G_1 = (X + Y)/\sqrt{2}$ for question 1

The following auxiliary calculations will be helpful later:

$$\begin{aligned}\langle \text{EPR} | X \otimes X | \text{EPR} \rangle &= \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix} \\ &= \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix} = \frac{2}{2} = 1\end{aligned}$$

$$\begin{aligned}
\langle \text{EPR} | Y \otimes Y | \text{EPR} \rangle &= \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 & 0 & 0 & -1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ -1 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix} \\
&= \frac{1}{2} \begin{pmatrix} -1 & 0 & 0 & -1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix} = -1
\end{aligned}$$

$$\begin{aligned}
 \langle \text{EPR} | X \otimes Y | \text{EPR} \rangle &= \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} 0 & 0 & 0 & -i \\ 0 & 0 & i & 0 \\ 0 & -i & 0 & 0 \\ i & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix} \\
 &= \frac{1}{2} \begin{pmatrix} i & 0 & 0 & -i \end{pmatrix} \begin{pmatrix} 1 \\ 0 \\ 0 \\ 1 \end{pmatrix} = 0
 \end{aligned}$$

$$\langle \text{EPR} | Y \otimes X | \text{EPR} \rangle = 0$$

Lets calculate the expected values of the sign $a \oplus b$:

$$\begin{aligned}\langle \text{EPR} | F_0 \otimes G_0 | \text{EPR} \rangle &= \langle \text{EPR} | X \otimes \frac{1}{\sqrt{2}}(X - Y) | \text{EPR} \rangle \\ &= \langle \text{EPR} | X \otimes \frac{1}{\sqrt{2}}X | \text{EPR} \rangle - \langle \text{EPR} | X \otimes \frac{1}{\sqrt{2}}Y | \text{EPR} \rangle \\ &= \frac{1}{\sqrt{2}} - 0 = \frac{1}{\sqrt{2}}\end{aligned}$$

$$\begin{aligned}
\langle \text{EPR} | F_1 \otimes G_1 | \text{EPR} \rangle &= \langle \text{EPR} | Y \otimes \frac{1}{\sqrt{2}}(X + Y) | \text{EPR} \rangle \\
&= \langle \text{EPR} | Y \otimes \frac{1}{\sqrt{2}}X | \text{EPR} \rangle + \langle \text{EPR} | Y \otimes \frac{1}{\sqrt{2}}Y | \text{EPR} \rangle \\
&= 0 - \frac{1}{\sqrt{2}} = -\frac{1}{\sqrt{2}}
\end{aligned}$$

$$\begin{aligned}
\langle \text{EPR} | F_0 \otimes G_1 | \text{EPR} \rangle &= \langle \text{EPR} | X \otimes \frac{1}{\sqrt{2}}(X + Y) | \text{EPR} \rangle \\
&= \langle \text{EPR} | X \otimes \frac{1}{\sqrt{2}}X | \text{EPR} \rangle + \langle \text{EPR} | X \otimes \frac{1}{\sqrt{2}}Y | \text{EPR} \rangle \\
&= \frac{1}{\sqrt{2}} + 0 = \frac{1}{\sqrt{2}}
\end{aligned}$$

$$\begin{aligned}
\langle \text{EPR} | F_1 \otimes G_0 | \text{EPR} \rangle &= \langle \text{EPR} | Y \otimes \frac{1}{\sqrt{2}}(X - Y) | \text{EPR} \rangle \\
&= \langle \text{EPR} | Y \otimes \frac{1}{\sqrt{2}}X | \text{EPR} \rangle - \langle \text{EPR} | Y \otimes \frac{1}{\sqrt{2}}Y | \text{EPR} \rangle \\
&= 0 - \left(-\frac{1}{\sqrt{2}}\right) = \frac{1}{\sqrt{2}}
\end{aligned}$$

Thus, we have

$$\langle \text{EPR} | F_s \otimes G_t | \text{EPR} \rangle = \begin{cases} \frac{1}{\sqrt{2}}, & (0, 0), (1, 0), (0, 1) \\ -\frac{1}{\sqrt{2}}, & (1, 1) \end{cases}$$

which is equivalent to

$$\langle \text{EPR} | F_s \otimes G_t | \text{EPR} \rangle = \frac{(-1)^{s \wedge t}}{\sqrt{2}}, s, t \in \{0, 1\}$$

The bias of the entangled strategy equals

$$\begin{aligned}\mathbb{E}_{(s,t) \sim \pi} [\Sigma_{s,t} \langle \psi | F_s \otimes G_t | \psi \rangle] &= \\ &= \frac{1}{4} \sum_{s,t=0}^1 (-1)^{s \wedge t} \langle \text{EPR} | F_s \otimes G_t | \text{EPR} \rangle \\ &= \frac{1}{4} \cdot \frac{4}{\sqrt{2}} = \frac{1}{\sqrt{2}}\end{aligned}$$

The bias is $\frac{1}{\sqrt{2}}$ from which follows that the winning probability is by definition:

$$\frac{1}{2} + \frac{1}{2} \cdot \frac{1}{\sqrt{2}} = \cos(\pi/8) \approx 0.85 \dots$$

Outline

1 Introduction

- Basics
- Nonlocal games
- A special case of nonlocal games
- A specific example

2 Local and quantum correlation matrices

- Local correlation matrices
- Quantum correlation matrices
- The relations between quantum correlation and local correlation matrices

3 Grothendieck Inequality

Local correlation matrices

- Deterministic strategies of Alice and Bob correspond to vectors $\xi \in \{-1, 1\}^{\mathcal{S}}$, respectively $\eta \in \{-1, 1\}^{\mathcal{T}}$

Local correlation matrices

- Deterministic strategies of Alice and Bob correspond to vectors $\xi \in \{-1, 1\}^{\mathcal{S}}$, respectively $\eta \in \{-1, 1\}^{\mathcal{T}}$
- Their common answer is the product $\xi_i \eta_j$

Local correlation matrices

- Deterministic strategies of Alice and Bob correspond to vectors $\xi \in \{-1, 1\}^{\mathcal{S}}$, respectively $\eta \in \{-1, 1\}^{\mathcal{T}}$
- Their common answer is the product $\xi_i \eta_j$
- Instead of deterministic strategies they can also answer according to the probability distribution of random variables X_i, Y_j

Local correlation matrices

- Deterministic strategies of Alice and Bob correspond to vectors $\xi \in \{-1, 1\}^{\mathcal{I}}$, respectively $\eta \in \{-1, 1\}^{\mathcal{J}}$
- Their common answer is the product $\xi_i \eta_j$
- Instead of deterministic strategies they can also answer according to the probability distribution of random variables X_i, Y_j
- Their common answer is $\mathbb{E}[X_i Y_j]$

Local correlation matrices

- Deterministic strategies of Alice and Bob correspond to vectors $\xi \in \{-1, 1\}^{\mathcal{S}}$, respectively $\eta \in \{-1, 1\}^{\mathcal{T}}$
- Their common answer is the product $\xi_i \eta_j$
- Instead of deterministic strategies they can also answer according to the probability distribution of random variables X_i, Y_j
- Their common answer is $\mathbb{E}[X_i Y_j]$
- This information can be encoded in an $\mathcal{S} \times \mathcal{T}$ matrix

◀ Motivation Quantum

Definition

Let $(X_i)_{1 \leq i \leq m}$ and $(Y_j)_{1 \leq j \leq n}$ be families of random variables on a common probability space such that $|X_i|, |Y_j| \leq 1$ almost surely. Then $A = (a_{ij})$ is the corresponding *classical (or local) correlation matrix* if

$$a_{ij} = \mathbb{E}[X_i Y_j]$$

for all $1 \leq i \leq m, 1 \leq j \leq n$.

Lemma

$$\text{LC}_{m,n} = \text{conv}\{\xi \eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$$

Definition

Let $(X_i)_{1 \leq i \leq m}$ and $(Y_j)_{1 \leq j \leq n}$ be families of random variables on a common probability space such that $|X_i|, |Y_j| \leq 1$ almost surely. Then $A = (a_{ij})$ is the corresponding *classical (or local) correlation matrix* if

$$a_{ij} = \mathbb{E}[X_i Y_j]$$

for all $1 \leq i \leq m, 1 \leq j \leq n$.

- Set of all local correlation matrices: $\text{LC}_{m,n}$

Lemma

$$\text{LC}_{m,n} = \text{conv}\{\xi \eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$$

- No matter which probabilistic strategy there is a deterministic one which is at least as good as the one one chooses

$$LC_{m,n} \supset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}.$$

- $\xi\eta^T \in LC_{m,n}$ for all $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$ (Choose $X_i \equiv \xi_i, Y_j \equiv \eta_j$)

$$LC_{m,n} \supset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}.$$

- $\xi\eta^T \in LC_{m,n}$ for all $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$ (Choose $X_i \equiv \xi_i, Y_j \equiv \eta_j$)
- Suffices to show that $LC_{m,n}$ is convex.

$LC_{m,n} \supset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$.

- $\xi\eta^T \in LC_{m,n}$ for all $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$ (Choose $X_i \equiv \xi_i, Y_j \equiv \eta_j$)
- Suffices to show that $LC_{m,n}$ is convex.
- Let $a_{ij}^{(k)} = \mathbb{E}[X_i^{(k)} Y_j^{(k)}]$ for $k \in \{0, 1\}$

$LC_{m,n} \supset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}.$

- $\xi\eta^T \in LC_{m,n}$ for all $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$ (Choose $X_i \equiv \xi_i, Y_j \equiv \eta_j$)
- Suffices to show that $LC_{m,n}$ is convex.
- Let $a_{ij}^{(k)} = \mathbb{E}[X_i^{(k)} Y_j^{(k)}]$ for $k \in \{0, 1\}$
- Find $(X_i), (Y_j)$ with $|X_i|, |Y_j| \leq 1$ almost surely such that

$$\beta a_{ij}^{(0)} + (1 - \beta) a_{ij}^{(1)} = \mathbb{E}[X_i Y_j]$$

for $\beta \in [0, 1]$

$LC_{m,n} \supset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$.

- $\xi\eta^T \in LC_{m,n}$ for all $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$ (Choose $X_i \equiv \xi_i, Y_j \equiv \eta_j$)
- Suffices to show that $LC_{m,n}$ is convex.
- Let $a_{ij}^{(k)} = \mathbb{E}[X_i^{(k)} Y_j^{(k)}]$ for $k \in \{0, 1\}$
- Find $(X_i), (Y_j)$ with $|X_i|, |Y_j| \leq 1$ almost surely such that

$$\beta a_{ij}^{(0)} + (1 - \beta) a_{ij}^{(1)} = \mathbb{E}[X_i Y_j]$$

for $\beta \in [0, 1]$

- Define a Bernoulli random variable α (which is independent from $X_i^{(k)}, Y_j^{(k)}$) such that $\mathbb{P}(\alpha = 0) = \beta, \mathbb{P}(\alpha = 1) = 1 - \beta$ and set $X_i = X_i^{(\alpha)}, Y_j = Y_j^{(\alpha)}$

$LC_{m,n} \supset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$.

- $\xi\eta^T \in LC_{m,n}$ for all $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$ (Choose $X_i \equiv \xi_i, Y_j \equiv \eta_j$)
- Suffices to show that $LC_{m,n}$ is convex.
- Let $a_{ij}^{(k)} = \mathbb{E}[X_i^{(k)} Y_j^{(k)}]$ for $k \in \{0, 1\}$
- Find $(X_i), (Y_j)$ with $|X_i|, |Y_j| \leq 1$ almost surely such that

$$\beta a_{ij}^{(0)} + (1 - \beta) a_{ij}^{(1)} = \mathbb{E}[X_i Y_j]$$

for $\beta \in [0, 1]$

- Define a Bernoulli random variable α (which is independent from $X_i^{(k)}, Y_j^{(k)}$) such that $\mathbb{P}(\alpha = 0) = \beta, \mathbb{P}(\alpha = 1) = 1 - \beta$ and set $X_i = X_i^{(\alpha)}, Y_j = Y_j^{(\alpha)}$
- Then

$$\begin{aligned}\mathbb{E}[X_i Y_j] &= \mathbb{E}[X_i^{(\alpha)} Y_j^{(\alpha)} \mathbb{1}_{\{\alpha=0\}}] + \mathbb{E}[X_i^{(\alpha)} Y_j^{(\alpha)} \mathbb{1}_{\{\alpha=1\}}] \\ &= \beta \mathbb{E}[X_i^{(0)} Y_j^{(0)}] + (1 - \beta) \mathbb{E}[X_i^{(1)} Y_j^{(1)}]\end{aligned}$$

$$\text{LC}_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$$

- Let $a_{ij} = \mathbb{E}[X_i Y_j]$ for \mathbb{R} -valued random variables $(X_i), (Y_j)$ defined on a common probability space Ω with $|X_i|, |Y_j| \leq 1$ almost surely.

$$\text{LC}_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$$

- Let $a_{ij} = \mathbb{E}[X_i Y_j]$ for \mathbb{R} -valued random variables $(X_i), (Y_j)$ defined on a common probability space Ω with $|X_i|, |Y_j| \leq 1$ almost surely.
- Set $X = (X_1, \dots, X_m)$ and $Y = (Y_1, \dots, Y_n)$, then $X \in [-1, 1]^m$, $Y \in [-1, 1]^n$ almost surely.

$$LC_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$$

- Let $a_{ij} = \mathbb{E}[X_i Y_j]$ for \mathbb{R} -valued random variables $(X_i), (Y_j)$ defined on a common probability space Ω with $|X_i|, |Y_j| \leq 1$ almost surely.
- Set $X = (X_1, \dots, X_m)$ and $Y = (Y_1, \dots, Y_n)$, then $X \in [-1, 1]^m$, $Y \in [-1, 1]^n$ almost surely.
- Hypercube description by its vertices: $[-1, 1]^d = \text{conv}\{\xi \mid \xi \in \{-1, 1\}^d\}$

$$LC_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}$$

- Let $a_{ij} = \mathbb{E}[X_i Y_j]$ for \mathbb{R} -valued random variables $(X_i), (Y_j)$ defined on a common probability space Ω with $|X_i|, |Y_j| \leq 1$ almost surely.
- Set $X = (X_1, \dots, X_m)$ and $Y = (Y_1, \dots, Y_n)$, then $X \in [-1, 1]^m$, $Y \in [-1, 1]^n$ almost surely.
- Hypercube description by its vertices: $[-1, 1]^d = \text{conv}\{\xi \mid \xi \in \{-1, 1\}^d\}$
- Define random variables $\lambda_\xi^{(X)} : \Omega^m \rightarrow [0, 1]$ such that

$$X(\omega) = \sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) \xi$$

almost surely and $\sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) = 1$

$$LC_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}.$$

- Define random variables $\lambda_\xi^{(X)} : \Omega^m \rightarrow [0, 1]$ such that

$$X(\omega) = \sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) \xi$$

almost surely and $\sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) = 1$

$$LC_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}.$$

- Define random variables $\lambda_\xi^{(X)} : \Omega^m \rightarrow [0, 1]$ such that

$$X(\omega) = \sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) \xi$$

almost surely and $\sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) = 1$

- Using the same decomposition for Y we obtain

$$\begin{aligned} a_{ij} &= \mathbb{E}[X_i Y_j] = \mathbb{E}\left[\left(\sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)} \xi_i\right) \left(\sum_{\eta \in \{-1, 1\}^n} \lambda_\eta^{(Y)} \eta_j\right)\right] \\ &= \sum_{\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n} \mathbb{E}[\lambda_\xi^{(X)} \lambda_\eta^{(Y)}] \xi_i \eta_j \\ &= \left(\sum_{\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n} \mathbb{E}[\lambda_\xi^{(X)}] \mathbb{E}[\lambda_\eta^{(Y)}]\right) \xi_i \eta_j \end{aligned}$$

$$LC_{m,n} \subset \text{conv}\{\xi\eta^T \mid \xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n\}.$$

- Define random variables $\lambda_\xi^{(X)} : \Omega^m \rightarrow [0, 1]$ such that

$$X(\omega) = \sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) \xi$$

almost surely and $\sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)}(\omega) = 1$

- Using the same decomposition for Y we obtain

$$\begin{aligned} a_{ij} &= \mathbb{E}[X_i Y_j] = \mathbb{E}\left[\left(\sum_{\xi \in \{-1, 1\}^m} \lambda_\xi^{(X)} \xi_i\right) \left(\sum_{\eta \in \{-1, 1\}^n} \lambda_\eta^{(Y)} \eta_j\right)\right] \\ &= \sum_{\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n} \mathbb{E}[\lambda_\xi^{(X)} \lambda_\eta^{(Y)}] \xi_i \eta_j \\ &= \left(\sum_{\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n} \mathbb{E}[\lambda_\xi^{(X)}] \mathbb{E}[\lambda_\eta^{(Y)}]\right) \xi_i \eta_j \end{aligned}$$

- Due to $\sum_{\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n} \mathbb{E}[\lambda_\xi^{(X)}] \mathbb{E}[\lambda_\eta^{(Y)}] = 1$ the matrix (a_{ij}) is a convex combination of $\xi\eta^T$, $\xi \in \{-1, 1\}^m, \eta \in \{-1, 1\}^n$

Quantum correlation matrices

- Alice and Bob share a common state ρ and get inputs $i \in \mathcal{S}, j \in \mathcal{T}$

Motivation Locality

Quantum correlation matrices

- Alice and Bob share a common state ρ and get inputs $i \in \mathcal{S}, j \in \mathcal{T}$
- They perform measurements $\{F_s^\xi\}_{\xi=\pm 1}$, respectively $\{G_t^\eta\}_{\eta=\pm 1}$

Motivation Locality

Quantum correlation matrices

- Alice and Bob share a common state ρ and get inputs $i \in \mathcal{S}, j \in \mathcal{T}$
- They perform measurements $\{F_s^\xi\}_{\xi=\pm 1}$, respectively $\{G_t^\eta\}_{\eta=\pm 1}$
- The probability that their response is (ξ, η) for inputs (i, j) is given by $a_{ij} = \text{Tr}(\rho F_s^\xi \otimes G_t^\eta)$

Motivation Locality

Quantum correlation matrices

- Alice and Bob share a common state ρ and get inputs $i \in \mathcal{S}, j \in \mathcal{T}$
- They perform measurements $\{F_s^\xi\}_{\xi=\pm 1}$, respectively $\{G_t^\eta\}_{\eta=\pm 1}$
- The probability that their response is (ξ, η) for inputs (i, j) is given by $a_{ij} = \text{Tr}(\rho F_s^\xi \otimes G_t^\eta)$
- Again we can encode this information in a matrix

Motivation Locality

Definition

Let $(X_i)_{1 \leq i \leq m}$ and $(Y_j)_{1 \leq j \leq n}$ be self-adjoint operators on \mathbb{C}^{d_1} , respectively \mathbb{C}^{d_2} for some positive integers d_1, d_2 , satisfying $\|X_i\|_\infty, \|Y_j\|_\infty \leq 1$. $A = (a_{ij})$ is called *quantum correlation matrix* if there exists a state on $\mathbb{C}^{d_1} \otimes \mathbb{C}^{d_2}$ such that

$$a_{ij} = \text{Tr } \rho(X_i \otimes Y_j).$$

- $\pi(y_j)$ the projection of y_j then $\tilde{\beta}(x_i, \pi(y_j)) = \tilde{\beta}(x_i, y_j)$
- The vectors have still not the right dimension but again, we can project them onto vectors in \mathbb{R}^m

- In order to show

$$\text{QC}_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

we will use the following

- In order to show

$$\text{QC}_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

we will use the following

Proposition

For all $n \geq 1$ there is a subspace of the $2^n \times 2^n$ Hermitian matrices where every vector is the multiple of a unitary matrix.

- In order to show

$$\text{QC}_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

we will use the following

Proposition

For all $n \geq 1$ there is a subspace of the $2^n \times 2^n$ Hermitian matrices where every vector is the multiple of a unitary matrix.

- The proof is based on n -fold tensor products of the Pauli matrices which are the three matrices

$$X = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, Y = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, Z = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}, I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$

- $X = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$, $Y = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}$, $Z = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$, $I = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$

Proof.

- Define

$$U_i = I^{\otimes(i-1)} \otimes X \otimes Y^{\otimes(n-i)},$$

$$U_{n+i} = I^{\otimes(i-1)} \otimes Z \otimes Y^{\otimes(n-i)}, \quad i = 1, \dots, n$$

- U_i 's are anti-commuting traceless Hermitian unitaries, i.e. $U_i U_j = -U_j U_i$ for $i \neq j$ and $U_i^2 = I$
- For $X = \sum_{i=1}^{2n} \xi_i U_i$, $Y = \sum_{i=1}^{2n} \eta_i U_i$ we can calculate

$$\begin{aligned} XY &= \sum_{i=1}^{2n} \xi_i \eta_i I + \sum_{1 \leq i, j \leq 2n} \xi_i \eta_j U_i U_j \\ &= \sum_{i=1}^{2n} \xi_i \eta_i I + \sum_{1 \leq i < j \leq 2n} \xi_i \eta_j U_i U_j - \sum_{1 \leq i < j \leq 2n} U_i U_j = \sum_{i=1}^{2n} \xi_i \eta_i I \\ &= \langle \xi, \eta \rangle I. \end{aligned}$$

- The result follows by setting $X = Y$.

$$\text{QC}_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

- Let $(x_i)_{1 \leq i \leq m}, (y_j)_{1 \leq j \leq n} \subset \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j| \leq 1$.

$$\text{QC}_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

- Let $(x_i)_{1 \leq i \leq m}, (y_j)_{1 \leq j \leq n} \subset \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j| \leq 1$.
- Let $X_i = \sum_{k=1}^{\min\{m,n\}} x_i(k) U_i$ and $Y_j^T = \sum_{k=1}^{\min\{m,n\}} y_j(k) U_k$ where the U_i 's are $d \times d$ matrices with $d = 2^{\lceil \min\{m,n\}/2 \rceil}$

$$QC_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

- Let $(x_i)_{1 \leq i \leq m}, (y_j)_{1 \leq j \leq n} \subset \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j| \leq 1$.
- Let $X_i = \sum_{k=1}^{\min\{m,n\}} x_i(k) U_k$ and $Y_j^T = \sum_{k=1}^{\min\{m,n\}} y_j(k) U_k$ where the U_i 's are $d \times d$ matrices with $d = 2^{\lceil \min\{m,n\}/2 \rceil}$
- $\text{Tr}(X_i Y_j^T) = d \cdot \langle x_i, y_j \rangle$ and $\|X_i\|_\infty \leq 1$ since $X_i X_i^* = |x_i|^2 I$ and $|x_i|^2 \leq 1$ (the same holds for Y_j)

$$\mathcal{QC}_{m,n} \supset \{(\langle x_i, y_j \rangle)_{1 \leq i \leq m, 1 \leq j \leq n} \mid x_i, y_j \in \mathbb{R}^{\min\{m,n\}}, |x_i| \leq 1, |y_j| \leq 1\}$$

- Then

$$\begin{aligned} \text{Tr}(\rho X_i \otimes Y_j) &= \frac{1}{d} \sum_{1 \leq k, l \leq d} \text{Tr}(|k\rangle \langle l| X_i \otimes |k\rangle \langle l| Y_j) \\ &= \frac{1}{d} \sum_{1 \leq k, l \leq d} \text{Tr}(|k\rangle \langle l| X_i) \text{Tr}(|k\rangle \langle l| Y_j) \\ &= \frac{1}{d} \text{Tr} X_i Y_j^T = \langle x_i, y_j \rangle. \end{aligned}$$

- $QC_{m,n}$ is convex

- $\text{QC}_{m,n}$ is convex
- Let $a_{ij} = \langle x_i, y_j \rangle$ and $\bar{a}_{ij} = \langle \bar{x}_i, \bar{y}_j \rangle$ for $x_i, y_j, \bar{x}_i, \bar{y}_j \in \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j|, |\bar{x}_i|, |\bar{y}_j| \leq 1$.

- $\text{QC}_{m,n}$ is convex
- Let $a_{ij} = \langle x_i, y_j \rangle$ and $\bar{a}_{ij} = \langle \bar{x}_i, \bar{y}_j \rangle$ for $x_i, y_j, \bar{x}_i, \bar{y}_j \in \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j|, |\bar{x}_i|, |\bar{y}_j| \leq 1$.
- define vectors $\tilde{x}_i := (\sqrt{\lambda}x_i, \sqrt{1-\lambda}\bar{x}_i)$, $\tilde{y}_j := (\sqrt{\lambda}y_j, \sqrt{1-\lambda}\bar{y}_j)$ for $\lambda \in [0, 1]$

- $QC_{m,n}$ is convex
- Let $a_{ij} = \langle x_i, y_j \rangle$ and $\bar{a}_{ij} = \langle \bar{x}_i, \bar{y}_j \rangle$ for $x_i, y_j, \bar{x}_i, \bar{y}_j \in \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j|, |\bar{x}_i|, |\bar{y}_j| \leq 1$.
- define vectors $\tilde{x}_i := (\sqrt{\lambda}x_i, \sqrt{1-\lambda}\bar{x}_i)$, $\tilde{y}_j := (\sqrt{\lambda}y_j, \sqrt{1-\lambda}\bar{y}_j)$ for $\lambda \in [0, 1]$
- it holds $|\tilde{x}_i| \leq \lambda|(x_i, 0)| + (1-\lambda)|(0, \bar{x}_i)| \leq 1$ and $\langle \tilde{x}_i, \tilde{y}_j \rangle = \lambda \langle x_i, y_j \rangle + (1-\lambda) \langle \bar{x}_i, \bar{y}_j \rangle$.

- $\text{QC}_{m,n}$ is convex
- Let $a_{ij} = \langle x_i, y_j \rangle$ and $\bar{a}_{ij} = \langle \bar{x}_i, \bar{y}_j \rangle$ for $x_i, y_j, \bar{x}_i, \bar{y}_j \in \mathbb{R}^{\min\{m,n\}}$ such that $|x_i|, |y_j|, |\bar{x}_i|, |\bar{y}_j| \leq 1$.
- define vectors $\tilde{x}_i := (\sqrt{\lambda}x_i, \sqrt{1-\lambda}\bar{x}_i)$, $\tilde{y}_j := (\sqrt{\lambda}y_j, \sqrt{1-\lambda}\bar{y}_j)$ for $\lambda \in [0, 1]$
- it holds $|\tilde{x}_i| \leq \lambda|(x_i, 0)| + (1-\lambda)|(0, \bar{x}_i)| \leq 1$ and $\langle \tilde{x}_i, \tilde{y}_j \rangle = \lambda \langle x_i, y_j \rangle + (1-\lambda) \langle \bar{x}_i, \bar{y}_j \rangle$.
- Right dimension is obtained by projecting $(\tilde{x}_i)_{1 \leq i \leq m}$, $(\tilde{y}_j)_{1 \leq j \leq n}$ on $\text{span}\{x_1, \dots, x_m\}$ or $\text{span}\{y_1, \dots, y_n\}$, as in the proof before.

The relations between quantum correlation and local correlation matrices

- $LC_{m,n} \subset QC_{m,n}$

The relations between quantum correlation and local correlation matrices

- $LC_{m,n} \subset QC_{m,n}$
- Set $x_i = \xi_i |0\rangle$ and $y_j = \eta_j |0\rangle$ it immediately follows $\xi_i \eta_j = \langle x_i, y_j \rangle$. Hence, $\xi \eta^T \in QC_{m,n}$ (rest follows with the convexity of $QC_{m,n}$)

The relations between quantum correlation and local correlation matrices

- $LC_{m,n} \subset QC_{m,n}$
- Set $x_i = \xi_i |0\rangle$ and $y_j = \eta_j |0\rangle$ it immediately follows $\xi_i \eta_j = \langle x_i, y_j \rangle$. Hence, $\xi \eta^T \in QC_{m,n}$ (rest follows with the convexity of $QC_{m,n}$)
- Inclusion is strict in general

- Let us consider the case $n = m = 2$.

- Let us consider the case $n = m = 2$.
- Recall $\text{LC}_{2,2} = \{\xi\eta^T \mid \xi \in \{-1, 1\}^2, \eta \in \{-1, 1\}^2\}$
- It holds

$$\text{LC}_{2,2} = \text{conv}\left\{\pm \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}, \pm \begin{pmatrix} -1 & -1 \\ 1 & 1 \end{pmatrix}, \pm \begin{pmatrix} -1 & 1 \\ -1 & 1 \end{pmatrix}, \pm \begin{pmatrix} -1 & 1 \\ 1 & -1 \end{pmatrix}\right\}.$$

- Let us consider the case $n = m = 2$.
- Recall $\text{LC}_{2,2} = \{\xi\eta^T \mid \xi \in \{-1, 1\}^2, \eta \in \{-1, 1\}^2\}$
- It holds

$$\text{LC}_{2,2} = \text{conv}\left\{\pm \begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}, \pm \begin{pmatrix} -1 & -1 \\ 1 & 1 \end{pmatrix}, \pm \begin{pmatrix} -1 & 1 \\ -1 & 1 \end{pmatrix}, \pm \begin{pmatrix} -1 & 1 \\ 1 & -1 \end{pmatrix}\right\}.$$

- We can also write it as in intersections of halfspaces:

$$\text{LC}_{2,2} = \{A \in \mathbb{R}^{2 \times 2} \mid -1 \leq \text{Tr} AM \leq 1 \text{ for all } M \in \mathcal{K}\}, \quad (1)$$

$$\text{where } \mathcal{K} = \left\{\frac{1}{2}\sigma\left(\begin{pmatrix} -1 & 1 \\ 1 & 1 \end{pmatrix}\right), \sigma\left(\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}\right) \mid \sigma \in \{\text{id}, (1\ 2), (1\ 3), (1\ 4)\}\right\}.$$

- We will show that the inclusion is strict by showing that both sets yield different values if we maximize in a certain direction

- We will show that the inclusion is strict by showing that both sets yield different values if we maximize in a certain direction
